Fundamental Constants

Edwin Williams LNE, Guest Scientist & NIST

CCM is asking:

What system is best for the CCM and your metrology Community? The new SI in which we scale our system by fixing the values of e, h, N_A and k provides:

A system that is favorable to the mass community.

- Agreement with other measurements of h and N_A .
- A system more stable over time and more suitable for the expression of the values of the fundamental constants. (P. Mohr)

What is needed to implement the new system?

- Educate your community.
- Implement the changes required to be consistent with new values of h and N_A.
- When? 2011 If 1ppm discrepancy resolved.

Atomic mass and quantum electric standards are more stable, long term, than macroscopic mass standards

What is the purpose of SI

- Provide a basis for a practical measurement system so that both science and industry can prosper
- We are being asked to simply choose the scales against which all measurements are made
 - We still have the same metric system but it won't drift and the scales will be clearer (have less uncertainty)

Scientists can only disprove theories never prove them.

- The SI assumes that our present knowledge is valid but it is understood that the sciences upon which it is based must be tested.
- The SI simply provides a system where we can compare results from around the world.
- The adjustment of the fundamental constants is the most stringent test we make of the system.
- Defining e, h, N_A and k make it easier for everyone to see the points of disagreement.
- The SI must adjust as new theories become "present knowledge".
 - JJ and QHE are driving the proposed redefinition.

Example:

Alpha, the fine-stucture constant

$$\alpha^{-1} = \frac{2h}{\mu_o c e^2} = \left\lfloor \frac{2i}{\mu_o c} (\mathbf{R}_{\mathrm{H}}) \right\rfloor$$

100 times less

Avogadro constant from h & h/m(X)

F. Biraben, et al. Laboratoire Kastler Brossel Laoratoire National de Metrologie et d'Essais Institut National de Metrologie,CNAM

$$N_{A} = \left\{ \frac{K_{J}^{2} R_{K} g^{(w)}}{4} \right\} \left\{ \frac{h}{m(^{87} \text{Rb}) g^{(a)}} \right\} \left\{ \frac{g^{(a)}}{g^{(w)}} \right\} A_{r}(^{87} \text{Rb}) M_{u}$$

Present

$$N_{\rm A} = \left\{\frac{1}{h}\right\} \left\{\frac{c\,\alpha^2}{2R_{\infty}}\right\} A_{\rm r}(m_{\rm e})M_{\rm u}$$

Redefining the kilogram is win-win for centuries into the future.

SI defined by fixing the values of a set of constants The International System of Units, the SI, is the system of units scaled so that the (1) ground state hyperfine splitting transition frequency of the cesium 133 atom $\Box \Delta v (^{133}Cs)_{hfs}$ is 9 192 631 770 hertz, (2) speed of light in vacuum c_0 is 299 792 458 meters per second, (3) Planck constant h is 6.626 069 3 x 10^{-34} joule second, $m(K) = 1 \text{ kg} (1 \pm 2 \times 10^{-8})$ (4) elementary charge e is 1.602 176 53 x 10^{-19} coulomb, $\mu_0 = 4\pi \times 10^{-7} \text{ N/A}^{-2}(1 \pm 7 \times 10^{-10})$ (5) Boltzmann constant k is 1.380 650 5 x 10⁻²³ joules per kelvin, Triple point $H_2O = 273.16 \text{ K} (1 \pm 2 \times 10^{-6})$ (6) Avogadro constant N_A is 6.022 141 5 x 10²³ per mole and Mole of $C_{12} = 12 \text{ g} (1 \pm 1.4 \text{ x} 10^{-9})$ (7) spectral luminous efficacy of monochromatic radiation of frequency 540 x 10¹² hertz $K(\lambda_{555})$ is 683 lumens per watt.

The Planck constant

The new SI; An opportunity

Provide the scientific community with an atomic based system.

- Use to steer new macroscopic mass.
- Science is the best source of new research.
- Opportunity to improve macroscopic mass dissemination.
 - Vacuum and inert gas environment.
 - Use a group of artifacts.
- Provide a opportunity for more fundamental research in mass metrology.
 - Need to compare Watt Balance and SI results.
 - Both vacuum masses and small masses tied to SI.

Explaining the kilogram

The kilogram is the mass of 6.022 141 5 $\times 10^{26}$ idealized atoms, each of these atoms having a mass such that the Planck constant, the most important constant in quantum mechanics, has the specified value of 6.626 069 3 $\times 10^{-34}$ joule second.

Such atoms have a mass very close (within an uncertainty of 1.4 ng/g) to 1/12th the mass of ¹²C. This means that a mole of ¹²C weighs $12 \times (1 \pm 1.4 \times 10^{-9})$ g.

Why Now?					
Nobel prizes in physics					
F. Bloch & E. Purcell	NMR	1952			
A. Kastler	Spectroscopy	1966			
Brian Josephson	Josephson effect	1973			
Klaus von Klitzing	QHE	1985			
Hans Dehmelt	Electron Traps	1989			
Norman Ramsey	Separate osc. Fields	1989			
Chu, Cohen-Tannoudji, Phillips	Atom cooling & trap	1997			
Cornell, Ketterle, Wieman	BEC	2001			
T. Hansch & J. Hall	Spectroscopy	2005			

Equations used to define or realize mass via from seven constants

$E = hv = mc^2$

Einstein

$$mgv = \frac{U^2}{R} = S\frac{V_J^2}{R_H}mgv = S\left(\frac{nf}{2}\right)^2 ih S\left(\frac{nf}{2}\right)^2 ih$$

$$\frac{I}{ie^2}$$

Watt balance

Measure atomic mass unit *u* from XRCD

 $u = m({}^{12}C/12) = m_e/A_r(e) = 2hR_{\infty}/\alpha^2 c A_r(e)$

 $A_{r}(e)$ = atomic mass of electron R_{∞} = Rydberg constant

The kilogram is the unit of mass; it is equal to the mass of the international prototype of the kilogram

CON:

- Can be damaged
 Gains mass from adsorption
 "Mass Correction" required after cleaning
- Long-term stability is inferred from other artifacts

PRO:: Worked well!

The ampere

The ampere is that constant current which, if maintained in two straight parallel conductors of infinite length, of negligible circular cross-section, and placed 1 meter apart in vacuum, would produce between these conductors a force equal to 2×10^{-7} newton per meter of length.

Physics tells us $F/l = (\mu_0 / 2\pi)(l^2/r)$

Magnetic permeability

 $\mu_0 = 4\pi \text{ x} 10^{-7} \text{ N/A}^2 (1+\epsilon) \text{ where } \epsilon = 0 \text{ in } 2011 \sigma_r = 7x10^{-10}$ Maxwell Eqs.?
